

# CSCE608:Project Par2:Explanation

Yixin Geng

October 16, 2013

The general idea of synthesizing the data is firstly synthesize the data for main table **BasicInfo**. Then according to the **PRIMARY KEY AID** in the table, I synthesize all other records. One thing important is that the dates of each tests and weighing should be later than the date of birth for each animals. And also there are some constraints for experimental data such as the duration time cannot be negative etc.
